

2.1-P14. Power of Imagery

The IFE14 scenario and play provided a tremendous example of the power of imagery when it comes to identifying areas where changes to the surface have occurred. In the run up to the IFE14 the PTS procured high resolution satellite imagery to be used as a possible data inject for both visible and 8-band formats. Our poster shows the “what if” of utilizing the full power of imagery to the IFE14 scenario. The scenario team controlled the data available to the IT and OSC from open and provided sources to images to those taken prior to May 2014. This was to prevent the Inspection Team from applying the change detection technique to the Inspection area and reveal the modification constructed for the IFE14 in the first days of the exercise. If such imagery were allowed it was felt that the exercise would have focused too quickly on these areas and lessened demonstration of integration and the synergy of using all of the techniques in a synergistic way to locate the relevant sites.
