

New insights into isotopic activity ratios of discharges from nuclear facilities

Martin Kalinowski¹, Matthias Auer¹, Ted Bowyer², Matthew Cooper², Charlie Doll², James Ely², Paul Eslinger², Judah Friese², Sid Hellman¹, Lori Metz², Mihaela Rizescu¹, Ramesh Sarathi², Brian Schrom², Cari Seifert²

¹Instrumental Software Technologies, Inc. (ISTI)

²Pacific Northwest National Laboratory (PNNL)

Presentation Date: 10 September 2025

Martin Kalinowski, Matthias Auer, Ted Bowyer, Matthew Cooper, Charlie Doll, James Ely, Paul Eslinger, Judah Friese, Sid Hellman, Lori Metz, Mihaela Rizescu, Ramesh Sarathi, Brian Schrom, Cari Seifert

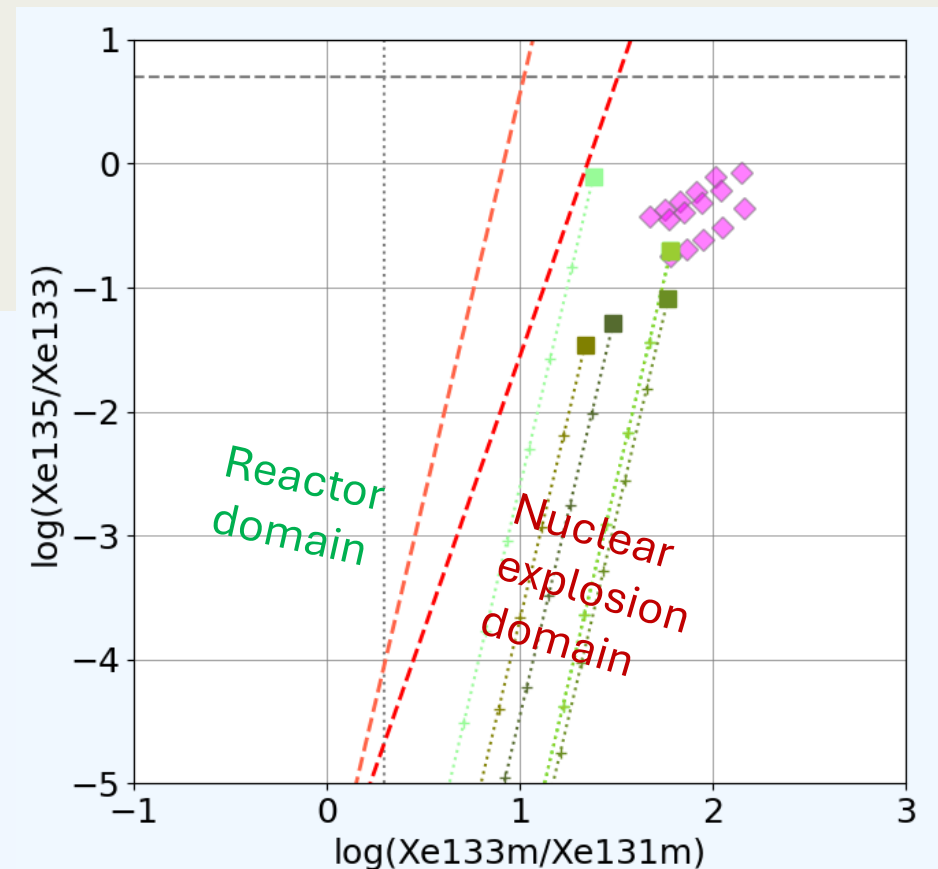

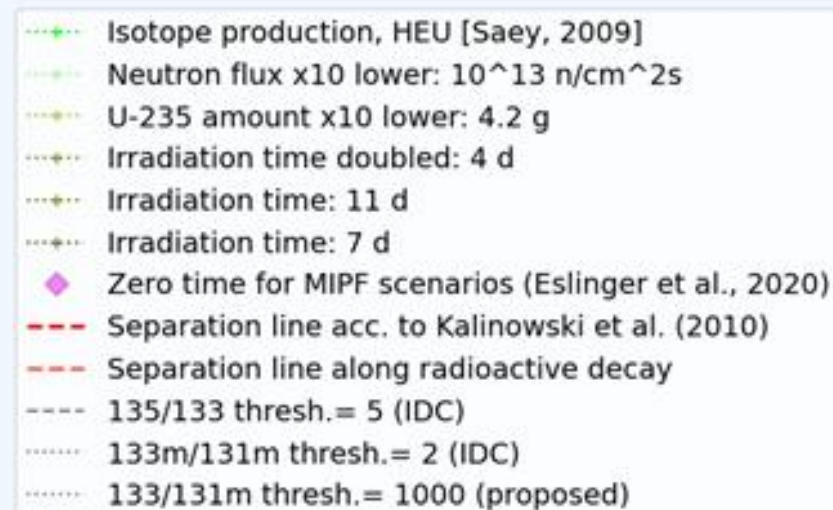

02.3-219

Discrepancy between Expectations and Observations

Expectations regarding the $^{133\text{m}}\text{Xe}/^{131\text{m}}\text{Xe}$ activity ratio in emissions from medical isotope production facilities

Target irradiation and cooling simulations

- ❖ Saey (2009)
- ❖ Eslinger et al. (2020)

Unexpected:
Observations are always found left to the separation line.

02.3-219

Overview of Data in Four-Isotope-Ratio Plot

Distribution of STAX measurements at two Medical Isotope Production Facilities

Martin Kalinowski, Matthias Auer, Ted Bowyer, Matthew Cooper, Charlie Doll, James Ely, Paul Eslinger, Judah Friese, Sid Hellman, Lori Metz, Mihaela Rizescu, Ramesh Sarathi, Brian Schrom, Cari Seifert

02.3-219

Overview of Hypothetical Explanations

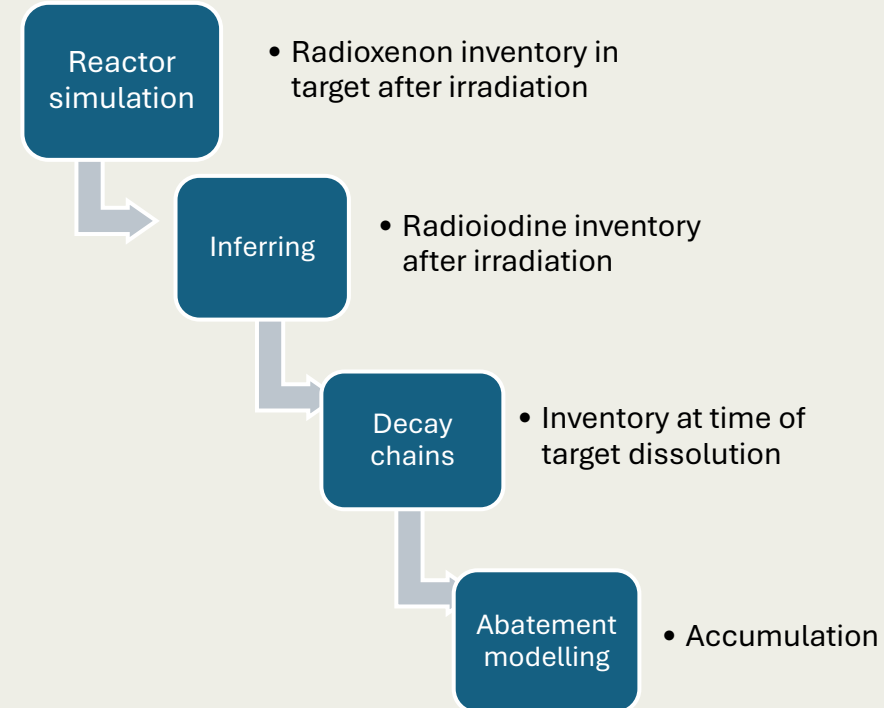

What is the reason for $^{133\text{m}}\text{Xe}/^{131\text{m}}\text{Xe}$ shifting towards lower values?

1. Radioactive decay of a pure iodine holdup
2. Accumulation of xenon and iodine from successive target dissolutions
3. Accumulation of pure iodine from successive target dissolutions
4. One-time mixing of decayed radioxenon gases with fresh radioxenon
5. One-time mixing of decay products from a stock of pure radioiodine with fresh radioxenon

Simulation Methods for Understanding Ratios at Discharge Time

- Initiation of the radioxenon inventory of the targets before dissolution takes place
- Inferring the radioiodine inventory of the targets from the radioxenon content
- Radioactive decay and in-growth before targets are dissolved
- Further in-growth and decay of the inventory in the abatement system
- Incremental accumulation of inventory in the abatement system

Martin Kalinowski, Matthias Auer, Ted Bowyer, Matthew Cooper, Charlie Doll, James Ely, Paul Eslinger, Judah Friese, Sid Hellman, Lori Metz, Mihaela Rizescu, Ramesh Sarathi, Brian Schrom, Cari Seifert

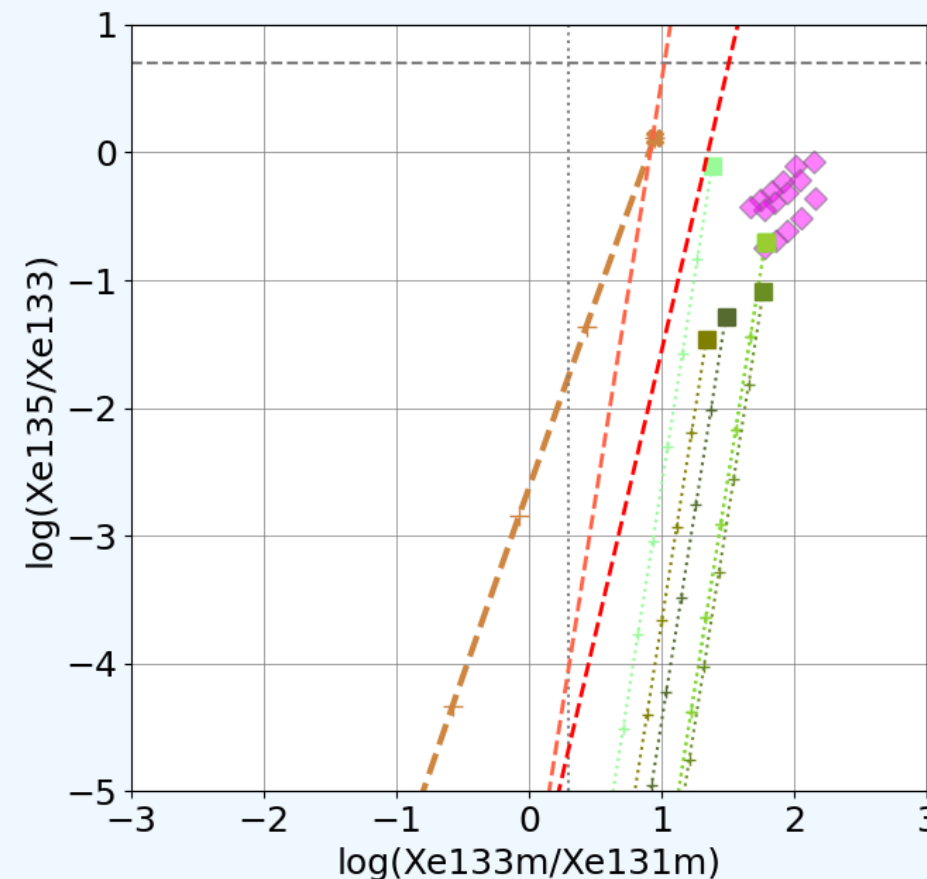

02.3-219

Radioactive Decay of a Pure Iodine Holdup

On the left side of the separation line.

But not going far enough.

- Isotope production, HEU [Saey, 2009]
- Neutron flux x10 lower: 10^{13} n/cm²s
- U-235 amount x10 lower: 4.2 g
- Irradiation time doubled: 4 d
- Irradiation time: 11 d
- Irradiation time: 7 d
- Zero time for MIPF scenarios (Eslinger et al., 2020)
- Decay products from iodine at target composition
- Separation line acc. to Kalinowski et al. (2010)
- Separation line along radioactive decay
- 135/133 thresh.= 5 (IDC)
- 133m/131m thresh.= 2 (IDC)
- 133/131m thresh.= 1000 (proposed)

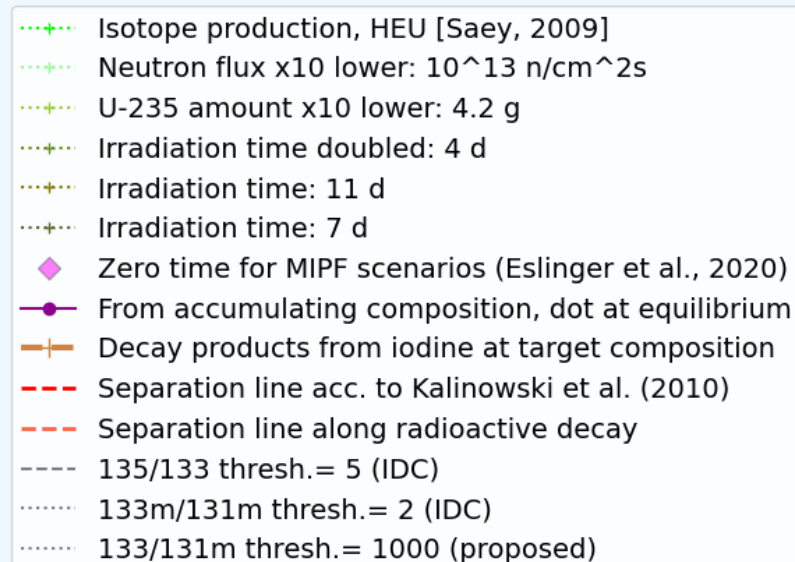

Martin Kalinowski, Matthias Auer, Ted Bowyer, Matthew Cooper, Charlie Doll, James Ely, Paul Eslinger, Judah Friese, Sid Hellman, Lori Metz, Mihaela Rizescu, Ramesh Sarathi, Brian Schrom, Cari Seifert

02.3-219

Accumulation of Xenon and Iodine from Successive Target Dissolutions

On the left side of the separation line along decay.

A little further but too low and not going far enough.

Martin Kalinowski, Matthias Auer, Ted Bowyer, Matthew Cooper, Charlie Doll, James Ely, Paul Eslinger, Judah Friese, Sid Hellman, Lori Metz, Mihaela Rizescu, Ramesh Sarathi, Brian Schrom, Cari Seifert

02.3-219

Accumulation of Pure Iodine from Successive Target Dissolutions

On the left side of the separation line.

A bit further, but still not going far enough.

- Isotope production, HEU [Saey, 2009]
- Neutron flux x10 lower: 10^{13} n/cm²s
- U-235 amount x10 lower: 4.2 g
- Irradiation time doubled: 4 d
- Irradiation time: 11 d
- Irradiation time: 7 d
- Zero time for MIPF scenarios (Eslinger et al., 2020)
- Decay from accumulating iodine, dot at equilibrium
- From accumulating composition, dot at equilibrium
- Decay products from iodine at target composition
- Separation line acc. to Kalinowski et al. (2010)
- Separation line along radioactive decay
- 135/133 thresh.= 5 (IDC)
- 133m/131m thresh.= 2 (IDC)
- 133/131m thresh.= 1000 (proposed)

Martin Kalinowski, Matthias Auer, Ted Bowyer, Matthew Cooper, Charlie Doll, James Ely, Paul Eslinger, Judah Friese, Sid Hellman, Lori Metz, Mihaela Rizescu, Ramesh Sarathi, Brian Schrom, Cari Seifert

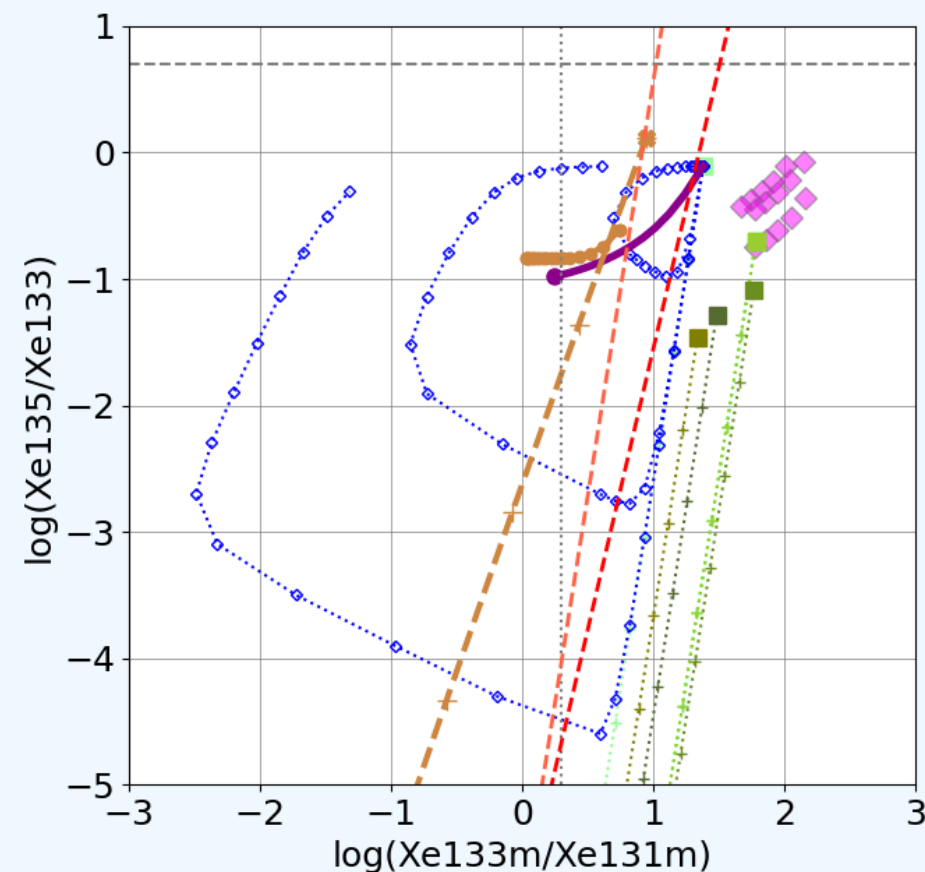

02.3-219

One-time Mixing of Decayed Radioxenon Gases with Fresh Radioxenon

Mostly on the left side of the separation line.

Filling the whole space.

- Isotope production, HEU [Saey, 2009]
- Neutron flux x10 lower: 10^{13} n/cm²s
- U-235 amount x10 lower: 4.2 g
- Irradiation time doubled: 4 d
- Irradiation time: 11 d
- Irradiation time: 7 d
- Zero time for MIPF scenarios (Eslinger et al., 2020)
- Decay from accumulating iodine, dot at equilibrium
- From accumulating composition, dot at equilibrium
- Decay products from iodine at target composition
- mixing 1:10 with xenon decay products
- mixing 1:1000
- mixing 1:100000
- Separation line acc. to Kalinowski et al. (2010)
- Separation line along radioactive decay
- 135/133 thresh.= 5 (IDC)
- 133m/131m thresh.= 2 (IDC)
- 133/131m thresh.= 1000 (proposed)

One-time Mixing of Decay Products from a Stock of Pure Radioiodine with Fresh Radioxenon

On the left side of the separation line along decay.

Filling the whole space even further.

- +--- Isotope production, HEU [Saey, 2009]
- +--- Neutron flux x10 lower: 10^{13} n/cm²s
- +--- U-235 amount x10 lower: 4.2 g
- +--- Irradiation time doubled: 4 d
- +--- Irradiation time: 11 d
- +--- Irradiation time: 7 d
- ◆ Zero time for MIPF scenarios (Eslinger et al., 2020)
- Decay from accumulating iodine, dot at equilibrium
- From accumulating composition, dot at equilibrium
- +— Decay products from iodine at target composition
- ◆◆◆ mixing 1:10 with iodine decay products
- ◆◆◆ mixing 1:1000
- ◆◆◆ mixing 1:100000
- - - Separation line acc. to Kalinowski et al. (2010)
- - - Separation line along radioactive decay
- - - 135/133 thresh.= 5 (IDC)
- 133m/131m thresh.= 2 (IDC)
- 133/131m thresh.= 1000 (proposed)

Martin Kalinowski, Matthias Auer, Ted Bowyer, Matthew Cooper, Charlie Doll, James Ely, Paul Eslinger, Judah Friese, Sid Hellman, Lori Metz, Mihaela Rizescu, Ramesh Sarathi, Brian Schrom, Cari Seifert

02.3-219

Comparison of Key Simulations with Time Series of MIPF Discharge Rates

Comparison with STAX data from a MIPF, including a trajectory showing decay in an outage period.

Evidence that mixing is the only physical process that can explain the data.

- Isotope production, HEU [Saey, 2009]
- Neutron flux x10 lower: 10^{13} n/cm²s
- U-235 amount x10 lower: 4.2 g
- Irradiation time doubled: 4 d
- Irradiation time: 11 d
- Irradiation time: 7 d
- Zero time for MIPF scenarios (Eslinger et al., 2020)
- Decay from accumulating iodine, dot at equilibrium
- From accumulating composition, dot at equilibrium
- Decay products from iodine at target composition
- mixing 1:10 with xenon decay products
- mixing 1:1000
- mixing 1:100000
- Separation line acc. to Kalinowski et al. (2010)
- Separation line along radioactive decay
- 135/133 thresh.= 5 (IDC)
- 133m/131m thresh.= 2 (IDC)
- 133/131m thresh.= 1000 (proposed)
- MIPF normal operation
- MIPF normal operation
- MIPF outage trajectory (see color map)

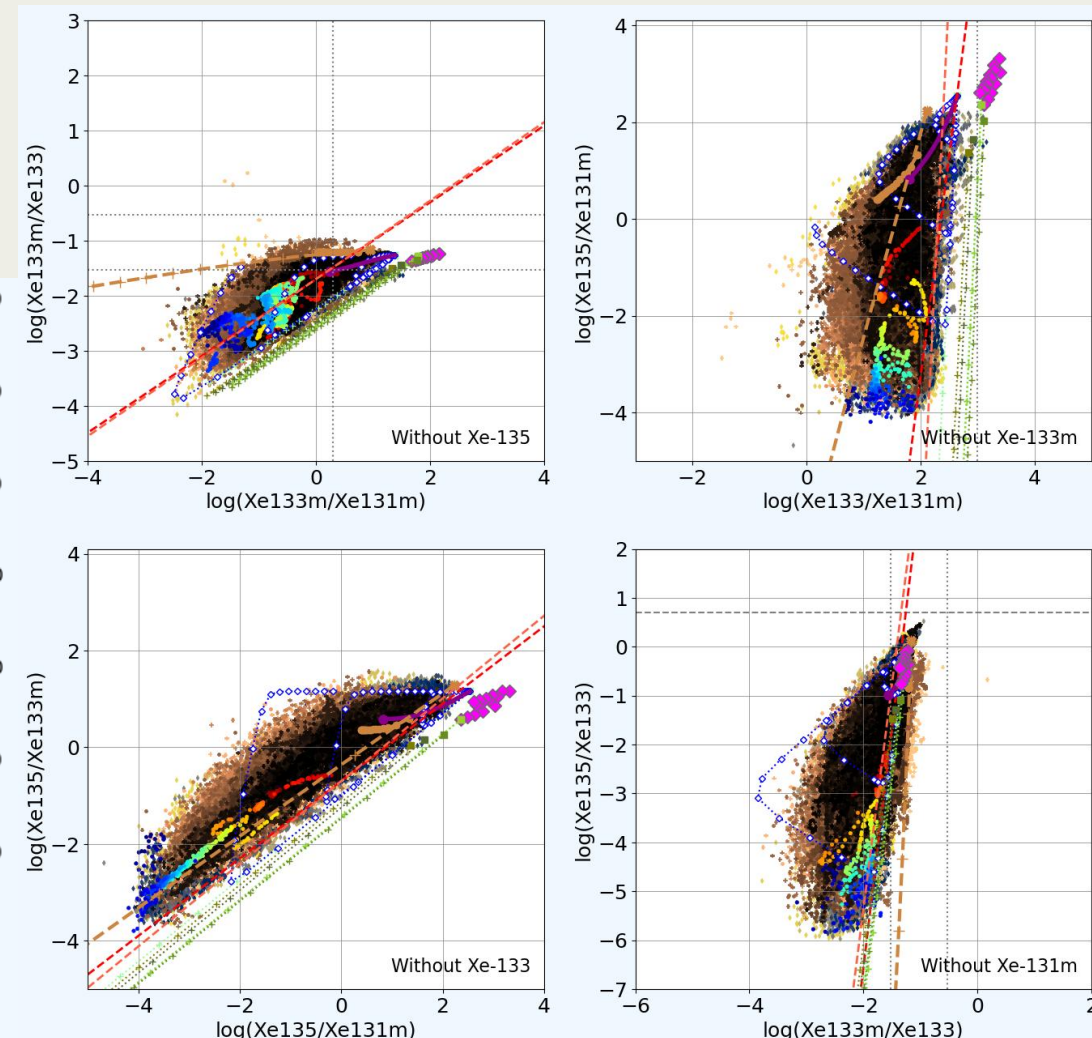

Results on three-isotope-ratio plots

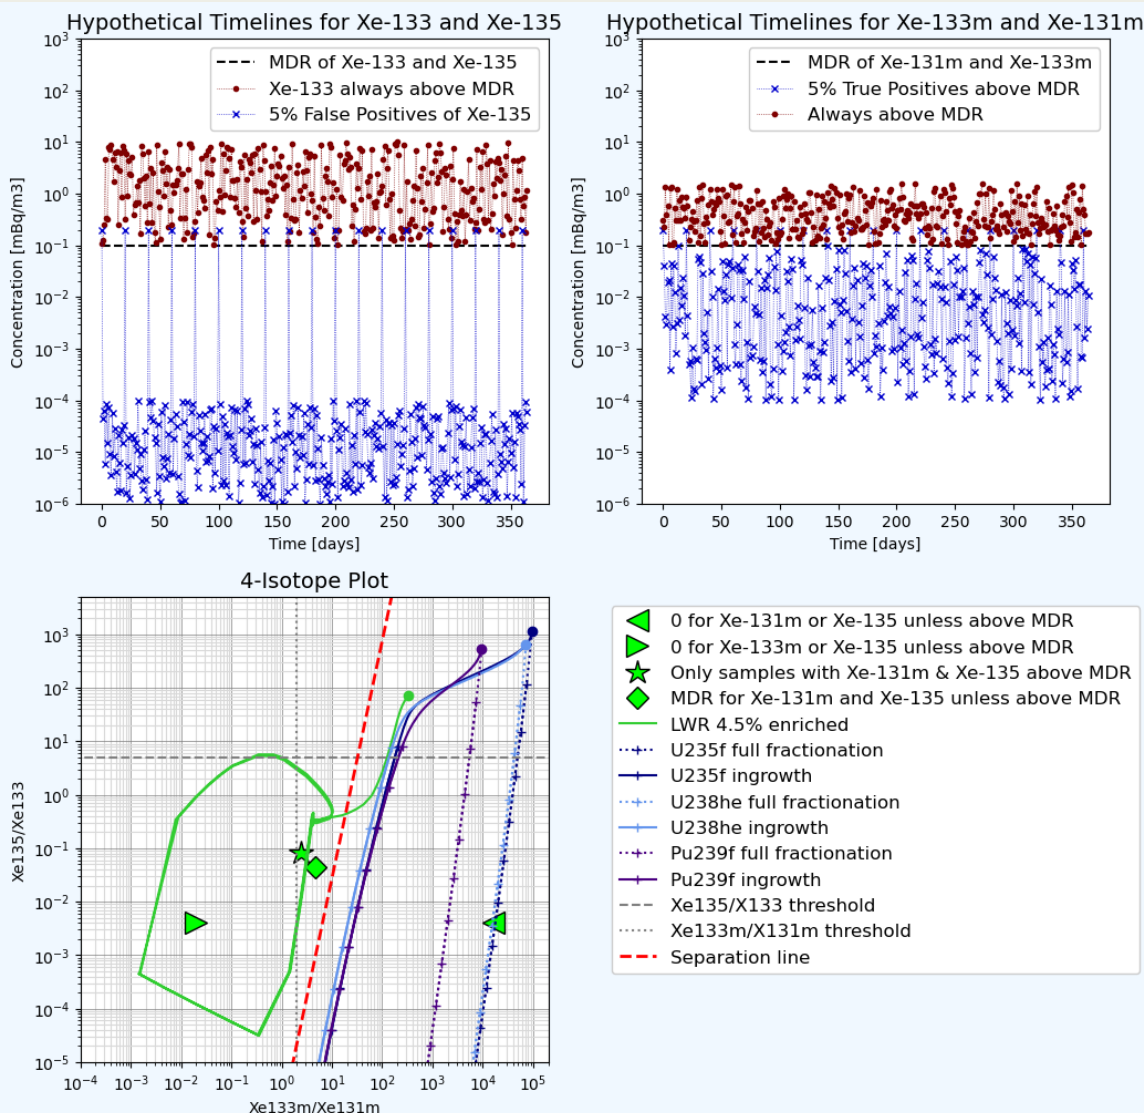

Demonstration of what effect the four hypothetical explanations have on four different combinations of three isotopes.

Mixing is the only physical process that can explain the full data spread except for a ratio combination not including ^{135}Xe .

- Isotope production, HEU [Saey, 2009]
- Neutron flux x10 lower: $10^{13} \text{ n/cm}^2\text{s}$
- U-235 amount x10 lower: 4.2 g
- Irradiation time doubled: 4 d
- Irradiation time: 11 d
- Irradiation time: 7 d
- ◆ Zero time for MIPF scenarios (Eslinger et al., 2020)
- Decay from accumulating iodine, dot at equilibrium
- From accumulating composition, dot at equilibrium
- Decay products from iodine at target composition
- mixing 1:10 with xenon decay products
- mixing 1:1000
- mixing 1:100000
- - - Separation line acc. to Kalinowski et al. (2010)
- - - Separation line along radioactive decay
- - - 135/133 thresh.= 5 (IDC)
- 133m/131m thresh.= 2 (IDC)
- 133/131m thresh.= 1000 (proposed)
- MIPF normal operation
- MIPF normal operation
- MIPF outage trajectory (see color map)

Effect caused by using non-representative values to substitute for a measurement below MDR

Top: Hypothetical data for a full year to be used to generate *annual total discharges* for each isotope.

Bottom: 3 different ways are used to substitute non-detections when estimating annual total discharges:

1. No substitution
2. Minimum Detectable Rate (MDR)
3. Zero

In the 4-isotope plot, the ratios of annual total discharges show large discrepancies despite same hypothetical data are used. The real value is anywhere between zero and MDR, i.e. the uncertainty is several orders of magnitude.

Martin Kalinowski, Matthias Auer, Ted Bowyer, Matthew Cooper, Charlie Doll, James Ely, Paul Eslinger, Judah Friese, Sid Hellman, Lori Metz, Mihaela Rizescu, Ramesh Sarathi, Brian Schrom, Cari Seifert

02.3-219

Summary and Conclusions

- Several hypotheses are tested to explain the shift of the $^{133m}\text{Xe}/^{131m}\text{Xe}$ isotopic activity ratios towards lower values.
- Decay products from pure radioiodine, accumulation of xenon and iodine from successive target dissolutions can explain a little shift.
- The full spread of the $^{133m}\text{Xe}/^{131m}\text{Xe}$ activity ratio can only be explained by the one-time mixing of decayed gases with a fresh radioxenon release.
- This was an open question for about 15 years, and the strongest mechanism (mixing) was published in 2006.
- What questions are left to be answered?
